Q1:
Create a tf_idf function to analyze word frequency, and print top 5 words' original index

Q2:
I totally follow the step list in assignment. There is 1 part I'm not sure I understand the meaning of the question: the part to calculate mean, min, and max viewpoint values for tags. Therefore, I use 3 different way to show different result.

Q3:
I understand the meaning of the question, but I cannot totally code it. Therefore, I skipped 2 step and just show the top 5 words with their frequency in the first 20 titles. I know this result may contain some 'stop word'. So it may be not helpful for us to find similar question or differentiate a question from dissimilar ones.

If it's not bothering, could you please send a solution code? Thank you!
